Heat shock protein 70 (Frament).
Dirofilaria immitis (Canine heartworm).
Eukaryota, Metazoa, Nematoda, Chromadorea, Spirurida, Filarioidea,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Culpepper J.A., Friedman L., Dale B.;
Submitted (AUG-1992) to the EMBL/GenBank/DDBJ databases.
-!- SIMILARITY: Belongs to the heat shock protein 70 family.
EMBL; M95648; AAA28298.1; -.

05-JUL-2004 (TrEMBLrel. 12, Last sequence update)
Heat shock protein 70 (71kDa heat shock connate protein).
Name-hsp70; Synonyms=HSC71;
Crassostrea gigas (Pacific oyster).
Eukaryota; Metazoa; Mollusca; Bivalvia; Pteriomorphia; Ostreoida;
Ostreoidea; Ostreidae; Crassostrea.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gourdon I., Gricourt L., Kellner K., Roch P., Escoubas J.-M.; "Characterization of a DNA encoding a 72 kDa heat shock cognate protein (HSC72) from the Pacific oyster, Crassostrea gigas."; DNA Seq. 11:265-270(2000).

Heat shock protein 70 (Heat shock protein Hsp70).
Name-HSP70; Synonyms-hsp70;
Gallus gallus (Chicken).
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;
Archosauria; Aves; Neognathae; Galliformes; Phasianidae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mazzi C.M., Ferro J.A., Ferro M.I.T., Miretti M.M., Givisiez P.B.N., Giachetto P.F., Macari M.;
Submitted (AUG-2002) to the EMBL/GenBank/DDBJ databases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mazzi C.M., Ferro J.A., Ferro M.I.T., Macari M., Furlan L.R., Submitted (AUG-2002) to the EMBL/GenBank/DDBJ databases.
-!- SIMILARITY: Belongs to the heat shock protein 70 family.
EMBL; AY288298; AAP77959.1; -.
                                                                                                                                                                                                                                                                                                                                                                                                                     Du H. Jr., Zhang X.;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
Roux A.-F., Nguyen V.T.T., Squire J.A., Cox D.W.;
"A heat shock gene at 14q22: mapping and expression.";
Hum. Mol. Genet. 3:1819-1822(1994).
-!-FUNCTION: In cooperation with other chaperones, Hsp70s stabilize preexistent proteins against aggregation and mediate the folding of newly translated polypeptides in the cytosol as well as within organelles. These chaperones participate in all these processes through their ability to recognize nomative conformations of other proteins. They bind extended peptide segments with a net hydrophobic character exposed by polypeptides during translation and membrane translated, or following stress-induced damage.
-!- SIMILARITY: Belongs to the heat shock protein 70 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               387 KSENVQDLLLLDVTPLSLGIETAGGVMTPLIKRNTTIPTKQTQTFTTYSDNQSSVLVQVY

Misolation and mucleotide sequence analysis of the rat testis-specific major heat-shock protein (HSP70)-related gene.";
Biochim. Biophys. Acts 1048:93-99(1990).
-I-FUNCTION: In cooperation with other chaperones, Hsp70s stabilize preexistent proteins against aggregation and mediate the folding of newly translated polypeptides in the cytosol as well as within organelles. These chaperones participate in all these processes through their ability to recognize nonnative conformations of other proteins. They bind extended peptide segments with a net
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-APR-1990 (Rel. 14, Last sequence update)

PEST
Bukaryota, Metazoa, Arthropoda, Hexapoda, Insecta, Pterygota,
Neoptera, Endopterygota, Diptera, Nematocera, Culicoidea, Anopheles.
NCBI_TaxID=180454,
hydrophobic character exposed by polypeptides during translation and membrane translocation, or following stress-induced damage. SIMILARITY: Belongs to the heat shock protein 70 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11;

Rybczynski R., Gilbert L.I.;

"CDNA cloning and expression of a hormone-regulated heat shock protein (hsc 70) from the prothoracic gland of Manduca sexta.";

Insect Biochem. Mol. Biol. 30:579-589(2000).

-I. SUBCELLULAR LOCATION: Nuclear (By similarity).

-I. SUBCELLULAR Back Heat shock cognate proteins are expressed constitutively during normal development.

-I. SIMILARITY: Belongs to the heat shock protein 70 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      386 KSEEVQDLLLLDVTPLSLGIETAGGVMSVLIKRNTTIPTKQTQTFTTXSDNQPGVLIQVF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            preexistent proteins against aggregation and mediate the folding of newly translated polypeptides in the cytosol as well as within organelles. These chaperones participate in all these processes through their ability to recognize nonnative conformations of other proteins. They bind extended peptide segments with a net hydrophobic character exposed by polypeptides during translation and membrane translocation, or following stress-induced damage. SIMILARITY: Belongs to the heat shock protein 70 family.
                                                                                                                                                                                                               KSENVQDLLLLDVAPLSLGLETAGGVMTALIKRNSTIPTKQTQIFTTYSDNQPGVLIQVY

"Cloning and characterization of a 70 kDa heat shock cognate gene.
"(HSC70) From two species of Chironomus.";
Insect Mol. Biol. 12:19-26(2003).
-I. SIMILARITY: Belongs to the heat shock protein 70 family.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                      US-09-646-835-1_COPY_384_641
